Explication de la variation du potentiel allergène des pollens de bouleau

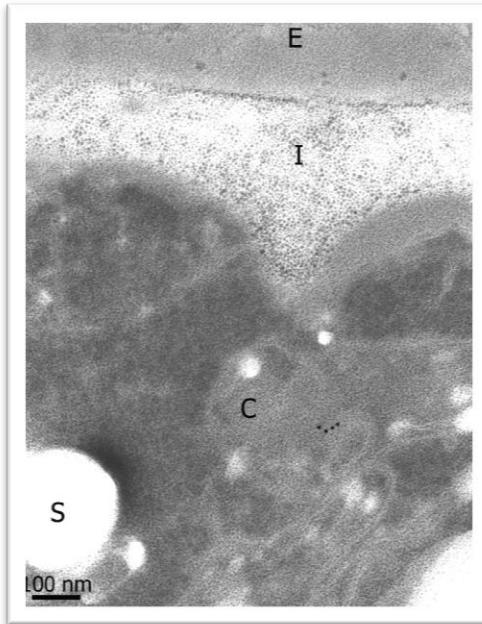

HIALINE
Health Impacts of Airborne Allergen Information Network

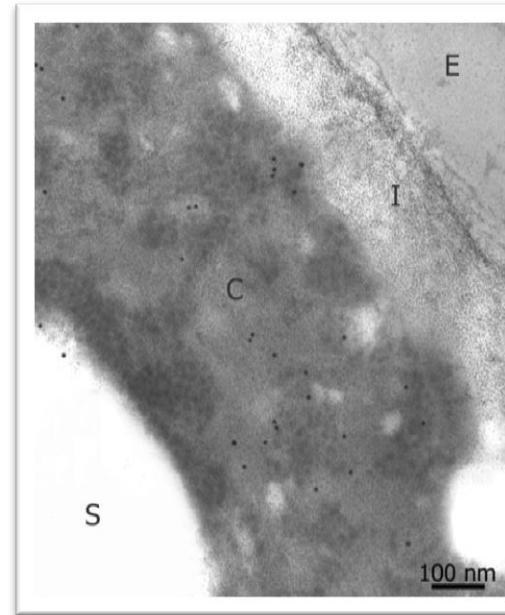

HIALINE is funded by the Executive Agency for Health and Consumers

Production de Bet v 1 juste avant la pollinisation

- Bet v 1 was stained with a biotinylated antibody 2E10 and counterstained with a 80 nm-gold particle labelled anti-biotin antibody -

29.3.2005

12.4.2005

Pollen from Antonienstrasse, Munich

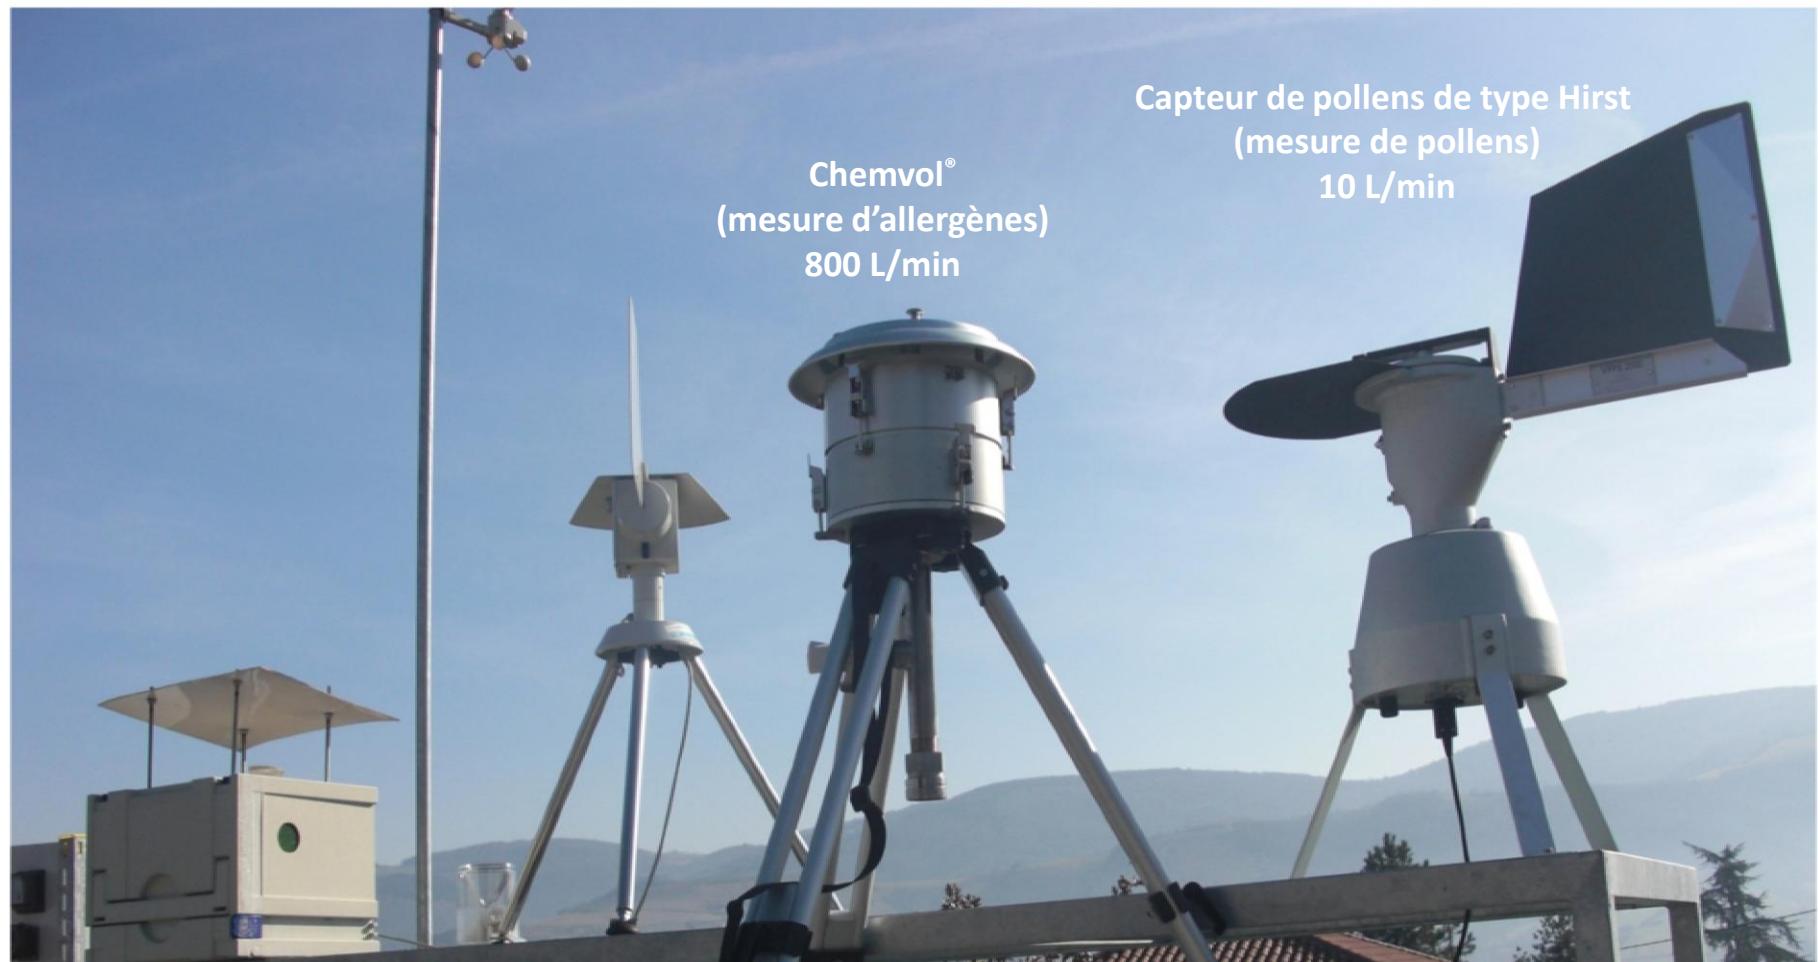

Si l'on considère les pollens de différents arbres de la même espèce, de différentes régions, de différentes années, et en fonction des jours, la libération de Bet v 1 par grain de pollen peut varier sensiblement.

Il est possible de dire qu'il peut y avoir jusqu'à 10 fois plus d'allergènes d'un grain à l'autre.

ABSTRACT

Exposure to allergens is pivotal in determining sensitization and allergic symptoms in individuals. Pollen grain counts in ambient air have traditionally been used to estimate airborne allergen exposure. However, the exact allergen content of ambient air is unknown. We therefore monitored atmospheric concentrations of birch pollen grains and the matched major birch pollen allergen Bet v 1 simultaneously across Europe within the EU-funded project HIALINE (Health Impacts of Airborne Allergen Information Network).

Inlet dust was assessed with HiFit type pollen traps at 1.01 min⁻³ at sites in France, United Kingdom, Germany, Italy and Finland. Allergen concentrations in ambient air were sampled at 800 l min⁻³ with a Chromex® high-volume cascade impactor equipped with stages PM > 10 µm, 10 µm > PM > 2.5 µm, and in Germany also 2.5 µm > PM > 0.22 µm. The major birch pollen allergen Bet v 1 was determined with an allergen specific ELISA. Bet v 1 isoforms patterns were analyzed by 2D-SDS-PAGE blots and mass spectrometric identification. Basophil activation was tested in an FcεRI-homologous rat basophil cell line passaged through human skin and pollen.

Compared to 10 years earlier, in 2009 was a representative birch pollen season for all stations. About 90% of the allergen was found in the PM > 10 µm fraction at all stations. Bet v 1 isoforms pattern did not vary substantially neither during dispensing of pollen nor between different geographical locations. The average European allergen release from birch pollen was 3.2 pg Bet v 1/pollen and did not vary much between the European countries. However, in all countries a >10-fold difference in daily allergen release per pollen was measured which could be explained by long-range transport of pollen with a deviating

Conclusions

- **Différents profils pour les pollens et leur contenu en allergène ont été observés**
- **Des quantités similaires de pollens à différents endroits géographiques produisent différentes quantités d'allergènes**
- **De plus, dans une même région, les quantités d'allergènes pour un pollen peuvent varier d'une année sur l'autre et également pendant une même saison**
- **Pollens différent en allergènes entre les différents pays**
